

**LogBible Platform User
Documentation**

1. Introduction

Running a digital spiritual platform is a powerful way to engage a modern audience, but traditional Bible apps are often static and text-heavy. They lack the interactivity and visual engagement that today's users expect.

LogBible changes this. It is a SaaS platform that combines the complete Holy Bible with advanced Artificial Intelligence. It allows users to read scripture, instantly generate clear theological explanations, and create unique AI-generated imagery for any verse.

As the **Owner**, you are not just running a website; you are managing a modern tool that helps people understand the Bible better while building a sustainable software business.

2. Owner Value: Why Run This App?

You are acquiring a fully functional SaaS (Software as a Service) platform. Here is what you gain:

- **Ownership:** You own the data, the user base, and the platform. You are not renting space on someone else's social network.
- **Monetization Potential:** You can control access to premium AI features. Users pay for the value the AI provides (explanations and image generation).
- **Automated Content:** The platform uses Google's Gemini AI to generate content. You do not need to write commentaries or hire artists; the system does it automatically on demand.
- **User Management:** You have a dashboard to see who is signing up and using the platform.
- **Low Maintenance:** Once the API keys are set, the application runs itself. Users interact with the Bible and the AI, while you focus on marketing and growth.

3. Roles on the Platform

Understanding who uses your app helps you manage it better.

The Owner (You)

You are the administrator. You have full control over the application settings.

- **Responsibilities:** Managing API connections (connecting the AI), monitoring user

activity, and ensuring the site is online.

- **Goal:** Grow the user base and ensure the AI services are running smoothly.

The User (The Customer)

These are the individuals coming to your site to study the Bible.

- **Responsibilities:** creating an account, reading scripture, requesting AI explanations, and generating images.
- **Goal:** To gain spiritual insight and visual aids for their personal study or ministry.

(Note: Unlike service booking apps, LogBible is a direct-to-consumer platform where the "Provider" is the automated AI system you manage.)

4. Get Value Quickly: Launch Guide

Follow these steps to take your application from "installed" to "open for business."

1. **Log in as Administrator** Access your admin panel using the credentials set up during installation. This is your command center.
2. **Connect the Intelligence** Navigate to **Admin Settings**. You will see a field for the **Gemini API Key**.
 - Get your key from Google.
 - Paste it here.
 - This single step powers all the explanation and image generation features.
3. **Verify the Bible Data** Go to the **Bible** section on the frontend. Ensure the books and chapters load correctly. The system comes pre-loaded with scripture data (ASV version).
4. **Set Your Business Rules** In the **Settings** tab, configure your site name and
